Visible-Surface Determination

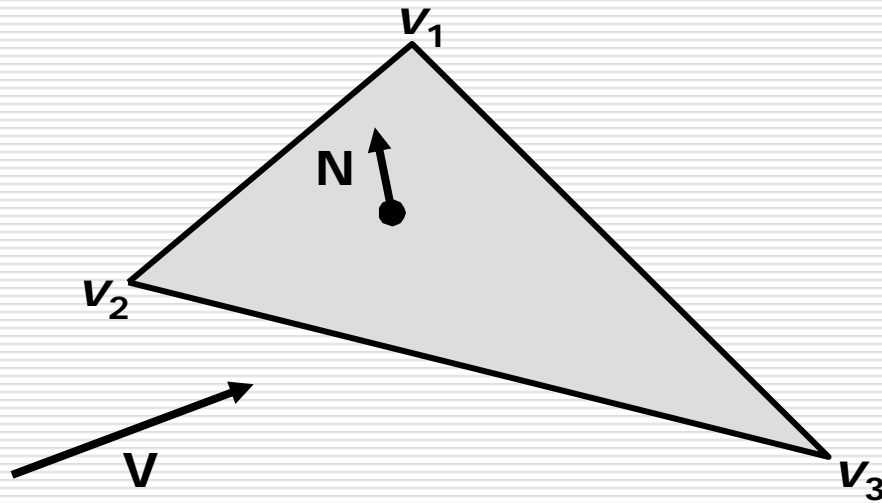

- Back-Face Culling
 - The Depth-Sort Algorithm
 - Binary Space-Partitioning Trees
 - The z-Buffer Algorithm
 - Scan-Line Algorithm
 - Visible-Surface Ray Tracing
 - Warnock's Algorithm
-

Back-Face Culling = Front Facing

Back-Face Culling = Front Facing

- use cross-product to get the normal of the face (not the actual normal)
- use inner-product to check the facing

$$N = (v_2 - v_1) \times (v_3 - v_1)$$

List-Priority Algorithms

- The Painter's Algorithm
 - The Depth-Sort Algorithm
 - Binary Space-Partitioning Trees
-

The Painter's Algorithm

- for the planes with constant z
 - not for real 3D, just for $2\frac{1}{2}D$

 - **sort** all polygons according to the smallest (farthest) z coordinate of each
 - **scan convert** each polygon in ascending order of smallest z coordinate (i.e., back to front)
-

The Depth-Sort Algorithm

- ❑ **sort** all polygons according to the smallest (farthest) z coordinate of each
 - ❑ resolve any ambiguities that sorting may cause when the polygons' z extents **overlap, splitting** polygons if necessary
 - ❑ **scan convert** each polygon in ascending order of smallest z coordinate (i.e., back to front)
-

Overlap Cases

Overlap Detection

- Do the polygons'x not overlap?
 - Do the polygons'y not overlap?
 - Is P entirely on the opposite side of Q's plane from the viewpoint?
 - Is Q entirely on the same side of P's plane as the viewpoint?
 - Do the projections of the polygons onto the (x,y) plane not overlap?
-

Binary Space-Partitioning Trees

- extremely efficient for static objects
-

The z-Buffer Algorithm

```
void zBuffer() {  
    int pz;  
    for (each polygon) {  
        for (each pixel in polygon's projection) {  
            pz = polygon's z-value at (x,y);  
            if (pz >= ReadZ(x,y)) {  
                WriteZ(x,y,pz);  
                WritePixel(x,y,color);  
            }  
        }  
    }  
}
```

The z-Buffer Algorithm

$$z_a = z_1 - (z_1 - z_2) \frac{y_1 - y_s}{y_1 - y_2}$$

$$z_b = z_1 - (z_1 - z_3) \frac{y_1 - y_s}{y_1 - y_3}$$

$$z_p = z_b - (z_b - z_a) \frac{x_b - x_p}{x_b - x_a}$$

Scan-Line Algorithm

Scan-Line Algorithm

- ET = edge table
 - PT = polygon table
 - AET = active-edge table
-

General Scan-Line Algorithm

add surfaces to surface table (ST);

initialize active-surface table (AST);

for (each scan line) {

 update AST;

for (each pixel on scan line) {

 determine surfaces in AST that project to pixel;

 find closest such surface;

 determine closest surface's shade at pixel;

 }

}

Ray Tracing = Ray Casting

```
select center of projection and window on viewplane;
for (each scan line in image) {
    for (each pixel in scan line) {
        determine ray from center of projection through pixel;
        for (each object in scene) {
            if (object is intersected and is closest considered thus far)
                record intersection and object name;
        }
        set pixel's color to that at closest object intersection;
    }
}
```

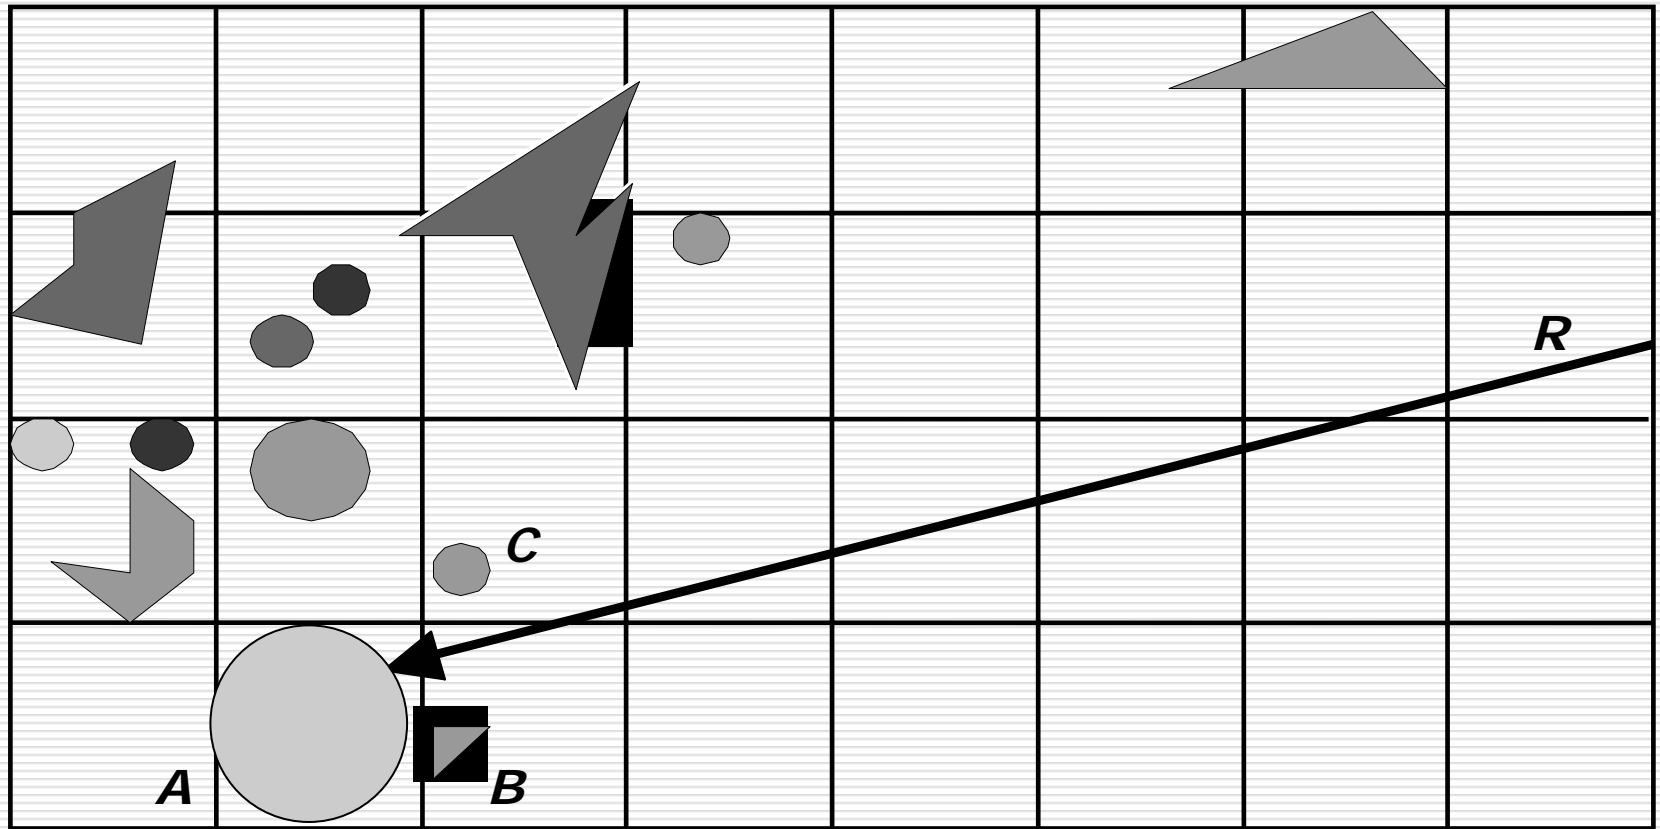

Ray Casting

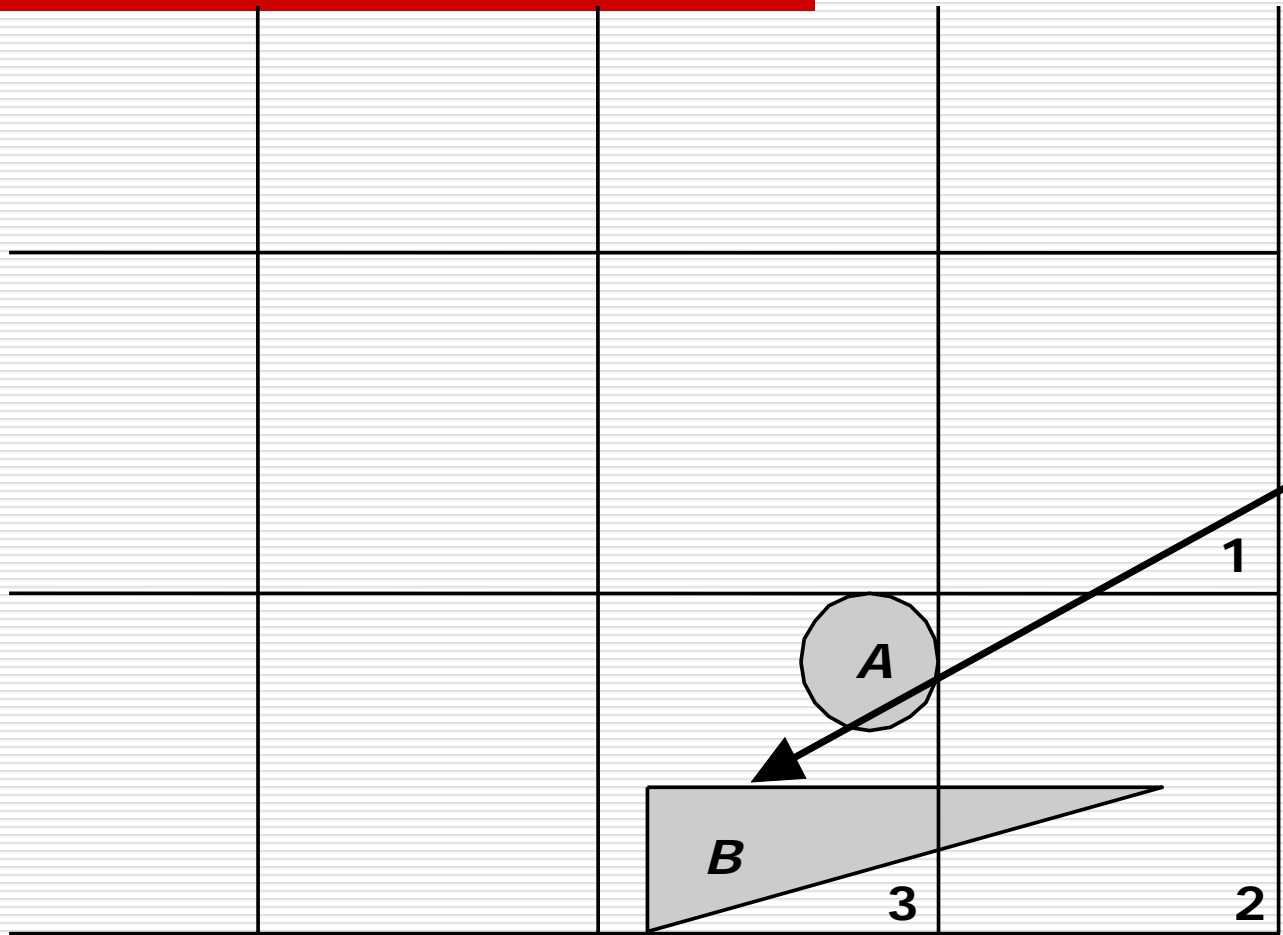

Spatial Partitioning

Spatial Partitioning

Spatial Partitioning

Warnock's Algorithm

1. all the polygons are disjoint from the area
 2. there is only one intersecting or only one contained polygon
 3. there is a single surrounding polygon, but no intersecting or contained polygons
 4. more than one polygon is intersecting, contained in, or surrounding the area, but one is a surrounding polygon that is in front of all the other polygons
-

Warnock's Algorithm

surrounding

intersecting

contained

disjoint

Warnock's Algorithm

Performance of Four Algorithms for Visible-Surface Determination

Algorithm	Number of Polygons		
	100	2,500	60,000
Depth sort	1	10	507
z-buffer	54	54	54
Scan line	5	21	100
Warnock area subdivision	11	64	307
